

Business Challenge:

Build an AI-supported cost estimation tool that turns diverse project documentation into a reliable quotation.

1 Challenge

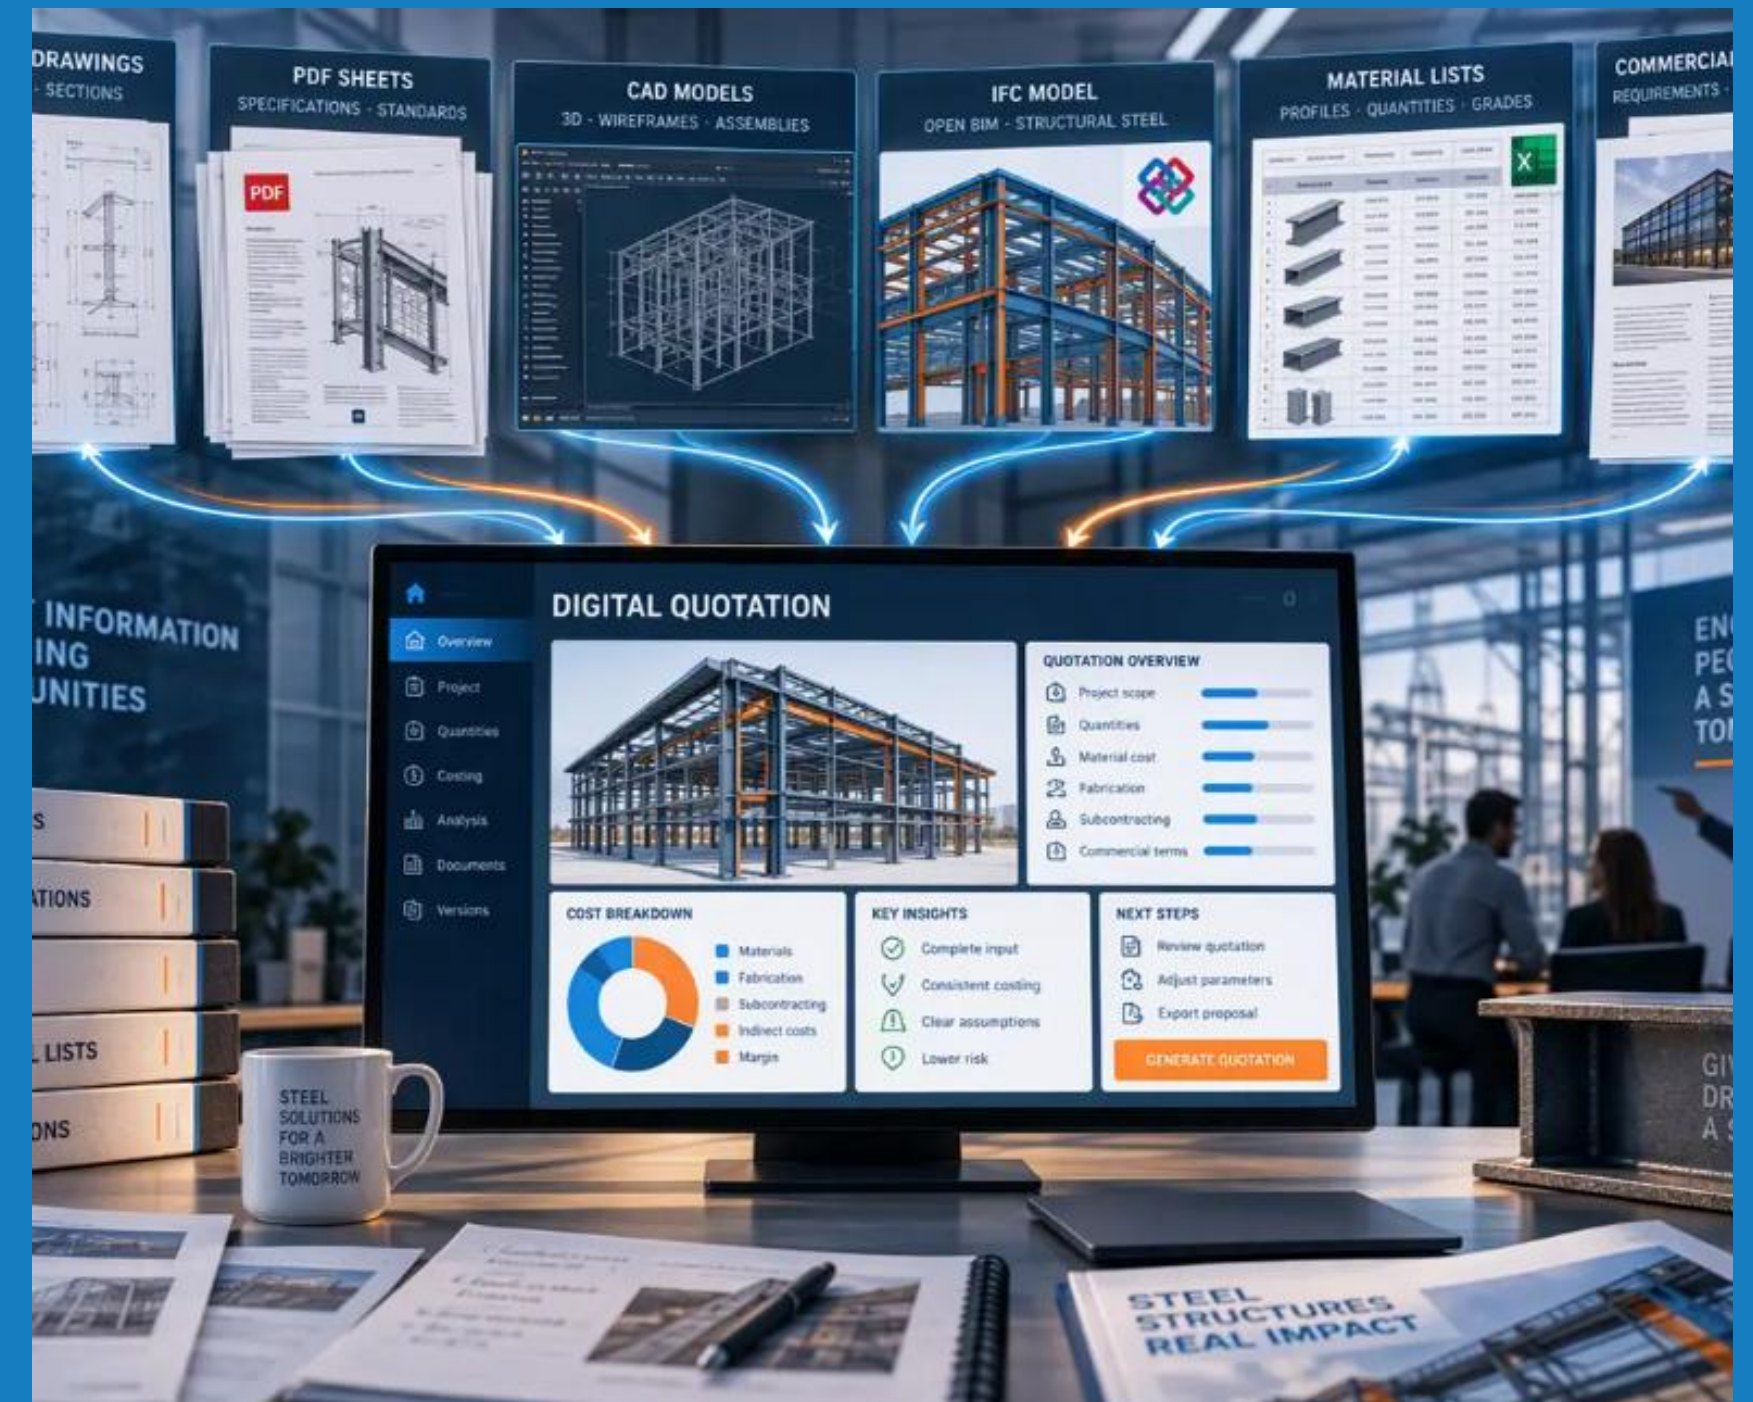

Business case description:

We receive over 500 price inquiries each year. Preparing detailed quotations manually, including material quantities and labour requirements, is time-consuming and depends heavily on experienced personnel.

The total work required can amount to several hundred hours per inquiry.

The input can range from a conceptual sketch to complete CAD/PDF drawings, material lists, IFC models and thousands of pages of specifications.

2 Context

What we are looking for:

01	INPUT INTERPRETATION	Identify the fabrication scope and required deliverables from mixed-quality drawings, models, lists and specifications.
02	QUANTITY & EFFORT	Extract material quantities and estimate fabrication labour, surface treatment, subcontracting, packaging and transport.
03	RISK & ASSUMPTIONS	Make missing information, assumptions, exclusions and technical or commercial risks explicit.
04	OUTPUT	Create a consistent and traceable cost estimate that an experienced estimator can review and adjust.

Think about the whole system:

TRACEABILITY

Can every quantity, cost driver and assumption be linked back to its source?

HUMAN CONTROL

Where must an experienced estimator review, correct or approve the result?

VARIABLE INPUT

How does the solution respond when documents are incomplete, inconsistent or overly detailed?

SCALABILITY

How can expert estimating logic be reused across thousands of annual inquiries?

Target outcome: faster bids, controlled margins and greater capacity to win business.

4 Success

What we expect / do not expect:

DO NOT EXPECT

- A complete understanding of the manufacturing process.
- A fully functional estimating tool.

EXPECTED

- A basic understanding of the manufacturing process.
- A proof of concept to support a go/no-go decision on further tool development.
- New approaches and out-of-the-box thinking to modernise traditional industry.
